DETAILED ACTION

Claims 11-16 examined on the merits.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 11-16 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-5 of U.S. Patent No. 6,721,329 B1. Although the conflicting claims are not identical, they are not patentably distinct from each other because it would have been obvious to one of ordinary skill in the art at the time the present application claims were made to make the present application claims broader than the patented application.

Comparison of the two applications:

Application/Control Number: 10/780,473

Art Unit: 2664

Claims 11, 12 and 15 of the present application (10/780,473) discloses a network and means for transmission of packets to a primary node according to predetermined transmission properties, further the network includes a first address translation means and a second address translation means for translating the address information back to the initial address information. Further, dependent claim 12 includes a selection means for a selector configured to select packets according to transmission properties contained in the address information in the packet headers.

Similarly, claims 1 and 5 of U.S. Patent No. 6,721,329 B1 also discloses a network for transmission of packets to a primary node according to predetermined transmission properties, further the network includes a first address translation translator and a second address translation translator for translating the address information back to the initial address information. The patented application further includes a selector configured to select packets according to transmission properties contained in the address information in the packet headers, within the independent claims 1 and 5.

The current application does not contain the last limitation within the independent claims, however, it is listed as dependent claim 12. Thus it would have been obvious to one of ordinary skill in the art at the time the invention was made to make the independent claims broader in scope without deviation from the main invention at hand by removing one or more of the narrower claim limitations. Thus, both the current application and the U.S. Patent No. 6,721,329 B1, have claim languages that are

Application/Control Number: 10/780,473

Art Unit: 2664

phrased differently to claim the same subject matter, thus they are not patentably distinct from each other.

Claim 15 of the present application (10/780,473) discloses a destination node receiving packets from a plurality of source nodes containing initial address information and performing the first address translation that contains the destination address, the destination node arranged to perform the second address translation back to the initial address information.

Similarly, claim 4 of U.S. Patent No. 6,721,329 B1 also discloses a primary node or the destination node receiving packets from a plurality of secondary nodes or source nodes containing the initial address information and performing the first address translation that contains the destination address, the primary node arranged to perform the second address translation back to the initial address information.

Thus, both the current application and the U.S. Patent No. 6,721,329 B1, have claim languages that are phrased differently to claim the same subject matter, thus they are not patentably distinct from each other.

Claims 13 and 14 of the present application are identical to claims 2 and 3 of U.S. Patent No. 6,721,329 B1.

This is a <u>provisional</u> obviousness-type double patenting rejection because the conflicting claims of the present application have not in fact been patented.

Art Unit: 2664

Allowable Subject Matter

The following is an examiner's statement of reasons for allowance:

Claims 11, 15, and 16 are allowed. The prior art discloses a communications system with a plurality of secondary nodes interconnected to one or more primary nodes which are arranged for receiving packets from the secondary nodes, whereby the secondary nodes performs an initial address translation providing information within the packet headers the address of the destination node or the primary node.

The prior art however fails to disclose the destination node or the receiving node performing a "reverse" address translation, translating the address back into the initial address information present in the packets as transmitted from the source node.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Raj Jain whose telephone number is 571-272-3145.

The examiner can normally be reached on M-F.

Art Unit: 2664

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wellington Chin can be reached on 571-272-3134. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 872-9306 for regular communications and (703) 872-9306 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 571-272-
